

CLAIMS

What is claimed is:

1. A hair holding device comprising:

a first body member and a second body member, said first and second body members comprising hair gripping portions adapted to be squeezed by a user whereby said hair gripping portions come into contact with gathered strands of a user's hair;

hinge means for pivotally connecting said first and second body members; and

adjustment means coaxially arranged with respect to said hinge means for causing said hair gripping portions to remain at a point at which said hair gripping portions are squeezed together by a user.

2. The hair holding device of claim 1 wherein said adjustment means comprise a slip friction mechanism.

3. The hair holding device of claim 2 wherein said slip friction mechanism comprises a first surface associated with said first body member, a second surface associated with said second body member, and biasing means for maintaining contact between said first and second surfaces such that a slip friction interface is created between said first and second surfaces.

4. The hair holding device of claim 3 wherein said slip friction interface extends perpendicular to said hinge means.

5. The hair holding device of claim 3 wherein at least one of said first and second surfaces is an irregular surface.

6. The hair holding device of claim 5 wherein at least one of said irregular surfaces is a toothed surface.

7. The hair holding device of claim 3 wherein said biasing means comprise a compression spring.
8. The hair holding device of claim 3 wherein said biasing means comprise a tension spring.
9. The hair holding device of claim 3 wherein said biasing means comprise a spring clip.
10. The hair holding device of claim 3 wherein at least one of said surfaces is integral with at least one of said first and second body members.
11. The hair holding device of claim 3 wherein at least one of said surfaces is provided on at least one insert carried by at least one of said first and second body members.
12. The hair holding device of claim 1 further comprising means for biasing said hair gripping portions into a predetermined position.
13. The hair holding device of claim 12 wherein said means for biasing comprise a torsion spring having a first end in contact with said first body member and a second end in contact with said second body member.
14. The hair holding device of claim 13 wherein said first and second body members further comprise handle portions that are squeezable by a user to release said hair gripping portions from the point at which said hair gripping portions are squeezed together by a user, and wherein said first end of said torsion spring is in contact with said handle portion of said first body member and said second end of said torsion spring is in contact with said handle portion of said second body member.
15. The hair holding device of claim 1 wherein said first and second body members further comprise handle portions that are squeezable by a user to release said hair gripping

portions from the point at which said hair gripping portions are squeezed together by a user.
